DETAILED ACTION

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on May 03, 2006 has been entered.
2. Applicants' response and amendment filed along with RCE on May 03, 2006 is considered. Currently Claims 15-17, 23-26, 31-41 are pending. Claims 15, 23, 25, 31, 38-39 are amended. Claims 1-14, 18-22, 27-30 are canceled.
3. The Declaration submitted under 37 CFR 1.132 has been considered.
4. Applicants' arguments and the amendment regarding the rejection under 35 USC 103(a) have been fully considered and the rejection is withdrawn herein in view of the amendment and the declaration.
5. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Please amend the claim 31 as follows:

End the claim 31 with a period.

6. The following is an examiner's statement of reasons for allowance:
Claims 15-17, 23-26, 31-41 are allowed.

The present invention is drawn to a method for determining the efficiency of an amplification of a target nucleic acid comprising preparing a dilution series of the target nucleic acid, amplifying the target nucleic acid in dilution series and measuring the amplification in real-time, setting a defined signal threshold value, determining for each dilution the cycle number at which the signal threshold value is exceeded, determining non-linear continuously differentiable function of a logarithm of the initial copy number of the target nucleic acid in the dilutions, wherein the non-linear continuously differentiable function is determined by a polynomial fit and calculating the amplification efficiency from said non-linear continuously differentiable function. The closest prior art Lowe et al. in view of Wittwer et al. teach a method for amplification in a dilution series of a target nucleic acid and setting a standard curve based on PCR threshold cycle for each target nucleic acid of interest in a linear equation, however the closest prior art did not teach non-linear continuously differentiable function of logarithm of the initial copy number of target nucleic acid in each of the multiple dilutions. Thus the instant invention was not taught or obvious over the closest prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
